

Security Intelligence:

Security Intelligence, threat intelligence or cyber threat intelligence is an important tool in preventing cyber-attacks. Traffic filtering takes place before any other policy-based inspection, analysis, or traffic handling. The security intelligence feed is regularly updated so the system has up-to-date information to filter network traffic. The Security Intelligence policy gives you an early opportunity to drop unwanted traffic based on source/destination IP address or destination URL. The system drops this unwanted traffic before evaluating it with the access control policy, thus reducing the amount of system resources used.

Cisco Talos Security Intelligence and Research Group:

Talos' IP and Domain Data Center is the world's most comprehensive real-time threat detection network. The data is made up of daily security intelligence across millions of deployed webs, email, firewall and IPS appliances. Talos detects and correlates threats in real time using the largest threat detection network in the world spanning web requests, emails, malware samples, open-source data sets, endpoint intelligence, and network intrusions. The Email and Web Traffic Reputation Center is able to transform some of Talos' data into actionable threat intelligence and tools to improve your security posture. Talos provides access to regularly updated security intelligence feeds. Sites representing security threats such as malware, spam, botnets, and phishing appear and disappear faster than you can update and deploy custom configurations. The system downloads feed updates regularly and thus new threat intelligence is available without requiring you to redeploy the configuration.

Security Devices regularly update SI feed and can create policies based on this feed like block all connection attempts to IP addresses denied in SI Feed.

Security Intelligence Sharing:

Sharing of threat information between organization becomes a key priority. Threat information needs to be standardized and structured. Structured Threat Information eXpression (STIX) enables security organizations to share threat intelligence in a consistent manner. Trusted Automated eXchange of Intelligence Information (TAXII) is a transport mechanism for sharing cyber threat intelligence.
