

OpenDNS:

- OpenDNS was founded in the Year of 2006, starting life as a Recursive DNS service.
- Goal was to provide faster & safer internet browsing for both home & business users.
- In 2012 it extended their services into Enterprise Business market with Umbrella service.
- OpenDNS Service Umbrella was cloud delivered service which enforces security DNS layer.
- OpenDNS Services as Umbrella protecting users both on and off the corporate network.
- Enterprise customers and corporate network were excited by the new Umbrella service.
- Focus soon turned to how Umbrella made decisions to categories domain or IP as malicious.
- Or safe, and whether this information could be made available to the Umbrella customers.
- With increasing requests for new requirement, OpenDNS team created a product based.
- On their internal intelligence console which in Year 2013 launched as OpenDNS Investigate.
- In 2016, after acquisition of OpenDNS, Cisco launched re-branded service Cisco Umbrella.

Cisco Umbrella:

- Umbrella is a cloud-native DNS platform that delivers the most reliable secure Internet.
- Umbrella is DNS platform fast internet experience to more than 100 million users daily.
- It brings together firewall, a secure web gateway, DNS-layer security, cloud access security.
- Threat intelligence solutions into single platform to help businesses secure their network.
- Cisco Umbrella makes it easy to extend protection to the roaming users and branch offices.
- Umbrella easily uncovers and blocks a broad spectrum of malicious domains, IPs, URLs.
- Huge numbers of global internet activity into combination of statistical & machine learning.
- Umbrella use this machine models to identify new attacks being staged on the internet.
- By enforcing security at the DNS and IP Layers, Cisco Umbrella blocks requests to malware.
- Blocks ransomware, Malicious activity, phishing & botnets before connection is established.
- Umbrella block all sort of Malicious activities before they reach to network or endpoints.
- Secure web gateway logs & inspects all web traffic for greater transparency and protection.
- Cisco Umbrella is a Cloud driven Secure Internet Gateway that provides WAN protection.
- Processes billions of requests per day, analyzing and learning internet activity to determine.
- As cloud-delivered service, Umbrella provides visibility needed to protect internet access.
- The Internet activity is logged and categorized by the type of security threat or web content.
- Cisco Umbrella is a cloud delivered solution that blocks malicious destinations using DNS.
- Cisco Umbrella has the ability to see attacks before the application connection occurs.
- This limits the load on a firewall or any other network security infrastructure device.
- Umbrella helps to reduce alerts and improve security operations and incident response.
- Umbrella looks at patterns of DNS requests from devices and uses them to detect attack.

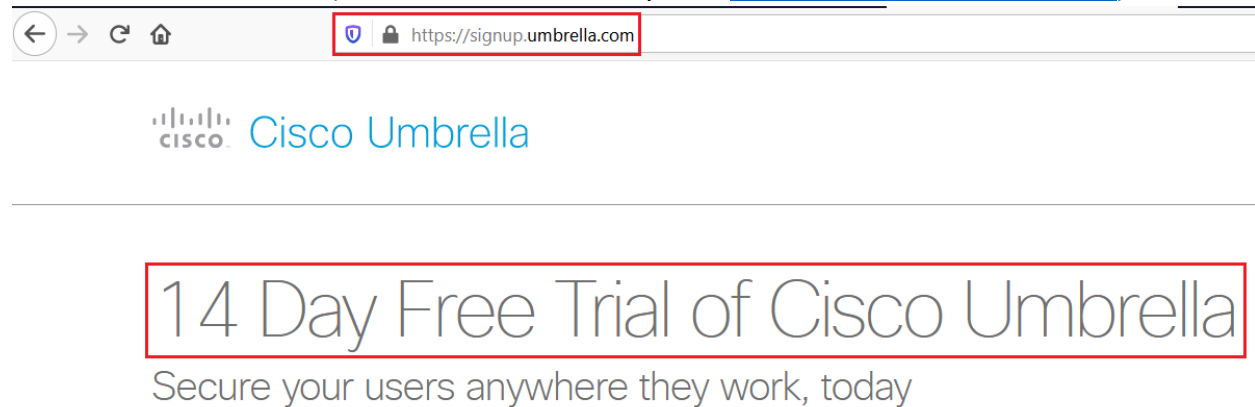

- It can be deployed using Umbrella virtual appliance utilized as conditional DNS forwarders.
- Virtual Appliances record the internal IP address information of DNS requests for usage in.
- Also, the Virtual Appliance (AP) provide more granular control in your Local Area Network.
- Can also just point DNS servers to the umbrella DNS servers or use the lightweight client.
- Which can be installed on endpoints and protect remote workers in Local Area Network.

Cisco Umbrella uses DNS, the Domain Name System, to forward requests from your networks and users to the Umbrella DNS resolvers, preventing threats over any port or protocol, not just HTTP & HTTPS traffic. With help of the roaming client even threats over direct IP connections can be stopped. Using DNS, we can make many threat discoveries, first off, all devices will send DNS requests to Cisco Umbrella, these request patterns will then be analyzed to detect threats and anomalies, before a decision is made whether to permit or deny the traffic.

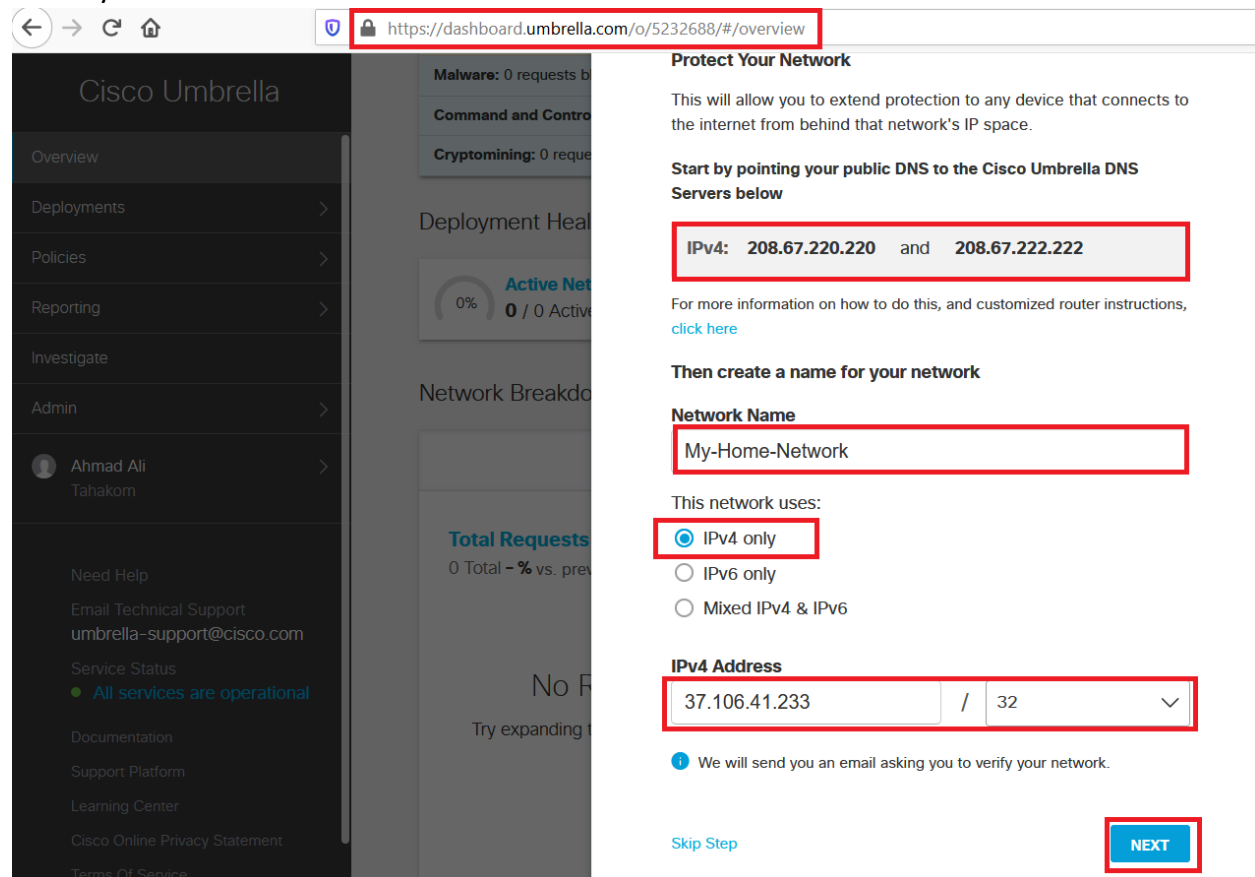

Cisco Umbrella Roaming for Windows:

Cisco Umbrella Licenses (or Free Umbrella 14-Day Trial <https://signup.umbrella.com/>)

Deploy Cisco Umbrella Roaming Client to your organization's Windows laptops (and desktop systems, if desired) and verify that it is working properly.

Select your network

Downloading the Umbrella Roaming Client for Windows.

The screenshot shows the Cisco Umbrella Setup page in a web browser. The browser address bar shows the URL: <https://dashboard.umbrella.com/o/5232688/#/overview>. The page title is "Cisco Umbrella Setup" with a subtitle "Add Roaming Computers". The main content area is titled "Protect Roaming Computers" and explains that users can protect laptops and desktops. It then lists two options: "Download Windows Client" (Supported Versions: Windows 7, 8, 10) and "Download Mac OS X Client" (Supported Versions: OS X 10.9+). The "Download Windows Client" option is highlighted with a red box. Below these options, there is a link to the "Roaming Client Setup Guide" and a section for "AnyConnect customers". At the bottom, there are buttons for "Skip This Step", "PREVIOUS", and "NEXT" (which is highlighted with a red box).

Cisco Umbrella Setup

Add Roaming Computers

Protect Roaming Computers

You can protect laptops and desktops, on and off the network. Our lightweight clients extend protection to the endpoints in your environment.

Cisco Umbrella roaming client

 **Download Windows Client**
Supported Versions: Windows 7, 8, 10

 **Download Mac OS X Client**
Supported Versions: OS X 10.9+

For more advanced setup instructions, read our [Roaming Client Setup Guide](#).

Or, if you are an AnyConnect customer...

If you use AnyConnect, we recommend the integrated Umbrella roaming security module over the standalone Umbrella roaming client.

Find the instructions on our [AnyConnect Client Setup Guide](#).

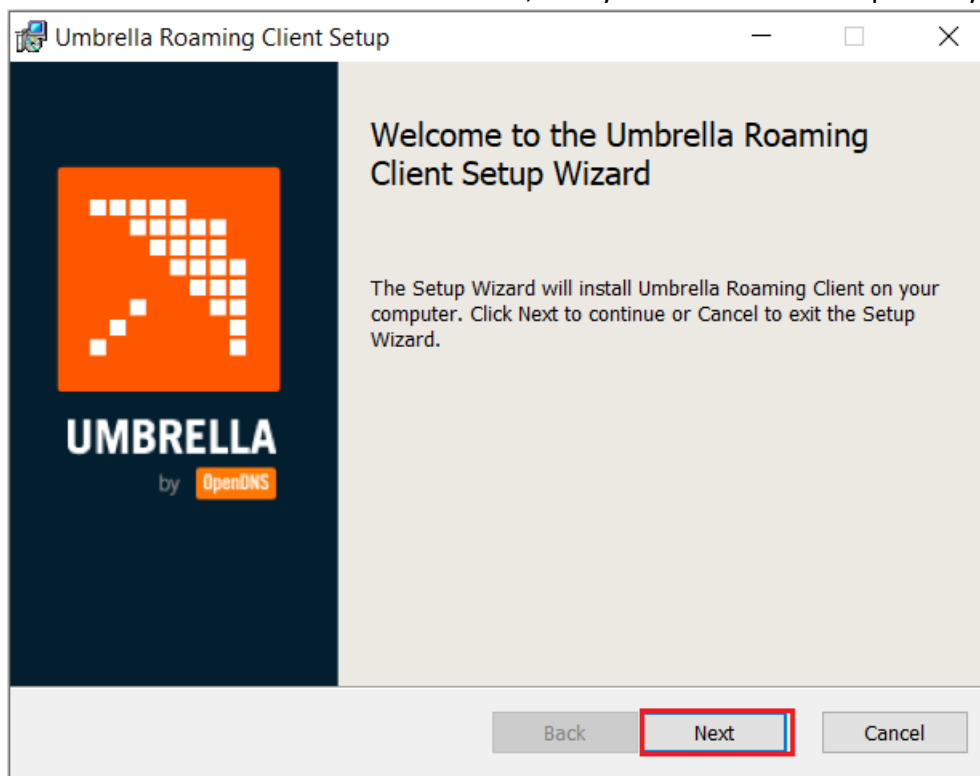

[Skip This Step](#) [PREVIOUS](#) [NEXT](#)

Extract the downloaded **OpenDNS-URC-win-2.0.xxx.zip** file and execute the **Setup.msi** file. The Umbrella Roaming Client Setup Wizard appears.

The screenshot shows the WinRAR interface with the file "OpenDNS-URC-win-2.2.356.zip" open. The file is an evaluation copy. The interface shows various tools like Add, Extract To, Test, View, Delete, Find, Wizard, Info, VirusScan, Comment, and SFX. The file list shows the following items:

Name	Size
..	
OrgInfo.json	125
readme.txt	1,649
Setup.msi	3,293,184

Click next next to install Windows Client, verify installation on computer by checking tray icon.

Begin by creating the policy you would like to apply to all users (with or without the client installed) when they are on one of your local networks.
