

EPP (Endpoint Protection Platform):

- o EPP is a solution deployed on endpoint devices to prevent file-based malware attacks.
- o Detect malicious activity & provide investigation & remediation capabilities to respond.
- o It provides remediation capabilities need to respond to dynamic security incidents & alerts.
- o Endpoint Protection Platform is an endpoint security capability designed to protect systems.
- o EPP security protect from compromise by preventing malicious software from executing.
- o EPP help prevent security threats, including known & unknown malware, on endpoints.
- o Endpoint Protection Platforms are designed to prevent attacks from traditional threats.
- o Such as known malware & advanced threats ransomware, zero-day vulnerabilities attacks.
- o EPP is an integrated security solution designed to detect and block threats at device level.
- o Its Includes antivirus, anti-malware, data encryption, personal firewalls, IPS and DLP.

EDR (Endpoint Detection and Response):

- o EDR solutions monitor endpoint and network events & record info in a central database.
- o So that you can perform further analysis, detection, investigation, and the reporting.
- o Typically, software (an agent) is installed on the endpoint that allows ongoing monitoring.
- o EDR works through continuous monitoring of the endpoint using Indicators of Compromise.
- o The EDR offers complete, in-depth visibility across all the organizations endpoints devices.
- o Endpoint Detection & Response tools work by continuously monitor activity on endpoints.
- o Endpoint Detection & Response aim identify suspicious or threatening behavior in real time.
- o Endpoint Detection & Response Info is recorded & analyzed for internal or external attacks.
- o EDR can identify specific behaviors alert organizations to potential threats before attackers.
- o Once threat has been detected, EDR can isolate & deflect attacks from internal & external.
- o Deflect attacks from internal & external sources, protecting endpoint devices from risks.
- o End-to-end analysis is supported by range of tech, including machine learning & behavioral.
- o EDR solutions help you detect and respond to incidents that managed to bypass your EPP.
- o The EDR platforms are cyber security systems that combine elements of next-gen antivirus.
- o With additional tools to provide real-time anomaly detection and alerting, forensic analysis.

EPP	EDR
First-line defense mechanism that prevents threats	Assumes a breach has already occurred and helps investigate and contain it
Does not require active supervision	Used actively by staff to respond to incidents
EPP Passive threat prevention	EDR is Active threat detection
Does not provide visibility into activity on the endpoint	Helps security teams aggregate event data from endpoints across the enterprise
Able to prevent known threats and some unknown threats	Enables immediate response to threats that EPP could not detect
Focused on protecting each endpoint in isolation	Provides data and context for attacks spanning multiple endpoints

Those who don't like to ever spill the milk (Those that want to make sure nothing malicious ever runs on an endpoint). Those that know the milk will spill, so they'd better get ready to clean it up (Detect when something malicious does execute and have a plan to remediate it).
