

Mobile Device Management (MDM):

The function of Mobile Device Managers, also known as Mobile Device Management (MDM), is to deploy, manage, and monitor the mobile devices that make up the Cisco BYOD solution. Uses: PIN lock, strong passwords, Detection of attempts to jailbreak or root, data encryption requirements, remotely wipe a stolen or lost BYOD, Administration and execution of data loss prevention (DLP). MDM application software is installed on servers that are located within the corporate data center and are completely supported and maintained by the network staff of the corporation or cloud-based MDM deployment.

Mobile device management is an industry term for the administration of mobile devices, such as smartphones, tablet computers and laptops.

Mobile Device Management (MDM) software is a vital component that monitors, safeguards, manages, and supports different types of mobile devices and tablets including iPhone, iPad, Android, and BlackBerry, along with the applications that run on them.

MDM is the process of monitoring, managing and securing mobile devices such as laptops, smartphones and tablets that are used in enterprises to access business-critical data. Mobile Device Management (MDM) is the trend of managing mobile devices that are used in organizations to access sensitive business data.

MDM can reduce support cost and minimize business threats just by safeguarding and controlling all the data and configuration settings of all the mobile devices in the network.

MDM gives admins a way to track lost or stolen mobile devices using GPS, remotely wipe data if and when required, and more.
