

Patch Management in the Cloud:

- o Patch Management is the process of detecting, downloading, testing and approving.
- o Installing new/missing patches for all Operating Systems & applications within network.
- o Patch management in cloud is also a shared responsibility in IaaS and PaaS environments.
- o Patch management in cloud is not responsibility in Software as a Service SaaS environment.
- o In the SaaS, CSP is the one responsible for patching all software & hardware vulnerabilities.
- o However, in an IaaS environment, the CSP is responsible only for patching the hypervisors.
- o in IaaS, CSP is responsible physical compute and storage servers, and the physical network.
- o You are responsible for patching apps, OS(VMs), and any virtual networks you deploy cloud.
