

Security Assessment in the Cloud:

- o Most of the CSP have a detailed guideline on how to perform security assessments.
- o Most of Cloud Service Provider have detailed guidelines penetration testing in cloud.
- o there are many potential threats when organizations want to move to a cloud model.
- o One security Assessment is what type of training does the provider offer its employees.
- o Check with CSP, does they provide the disaster recovery and business continuity plan.
- o If a security incident occurs, what support will you receive from the cloud providers.
- o Check how long has the cloud provider been in business, and what is its track record.
- o SLA serves as contract level of guaranteed service between cloud provider & customer.
- o Another Security Assessment to check what are the service level agreement (SLA) terms.
- o What type of encryption is being used, is it being used while data is at rest & in transit.
- o Another Security assessment check with CSP how data separated from other users' data.
- o Check with Cloud Service Provider is the data on a shared server or a dedicated system.
- o Check with Cloud Service Provider type of data classification system does provider use.
