

DevOps:

- o The word 'DevOps' is the combination of two words **development** and the **operations**.
- o DevOps helps to increase an organization's speed to deliver applications and services.
- o Allows organizations to serve their customers better & compete more strongly in market.
- o DevOps is culture which promotes collaboration between Development & Operations Team.
- o DevOps is culture to deploy code to production faster in an automated and repeatable way.
- o It is practice culture having union of people, process & tools which enables faster delivery.
- o Sandboxes Production like development & testing environments for a host of technologies
- o DevNet offers a host of sandboxes that enables hands-on exploration of software and APIs.
- o Can be defined as alignment of development & IT operations with better communication.
- o Can be defined as alignment of development and IT operations with better collaboration.
- o Before the DevOps, the development and operation team worked in complete isolation.
- o DevOps which promotes collaboration between Development team and Operations Team.
- o DevOps should be used for large distributed applications such as eCommerce websites.
- o It should be used for large distributed applications such as applications hosted on cloud.
- o It offers Maintainability, Predictability, Greater quality cost efficiency & time to market.
- o DevOps life cycle includes Development, Testing, Integration, Deployment, and Monitoring.
- o DevOps engineer will work with development team staff to tackle coding & scripting needs.
- o Helps organizations in shifting code deployment cycles to weeks & months instead of years.

DevOps is a software development approach which involves continuous development, continuous testing, continuous integration, continuous deployment and continuous monitoring of the software throughout its development life cycle. This is exactly the process adopted by all the top companies to develop high-quality software & shorter development life cycles, resulting in greater customer satisfaction, something that every company wants.

DevSecOps:

- o DevSecOps refers to integration of security practices into DevOps software delivery model.
- o DevSecOps, or Development, Security & Operations, is software development methodology.
- o Basically, DevSecOps that integrates security checks and practices into DevOps processes.
- o Implementing DevSecOps requires org to adopt security-first mindset at all stages projects.
- o DevSecOps practices aim to incorporate security throughout the DevOps workflow security.
- o Security issues must be found and resolved as early as possible to avoid delays in Project.
- o Ultimately, DevSecOps is important because it bakes security into SDLC earlier on purpose.
- o Scan phase consists of all manual or automated methods used for identifying vulnerabilities.
- o Scanning is only a means to identify the vulnerabilities before an outside attacker does.
- o Threat model consider possible attack scenarios, lays out flow of sensitive data within apps.
- o Finds mitigations to threats & repeats itself every time there is change in design of apps.
