

Cloud Logging and Monitoring:

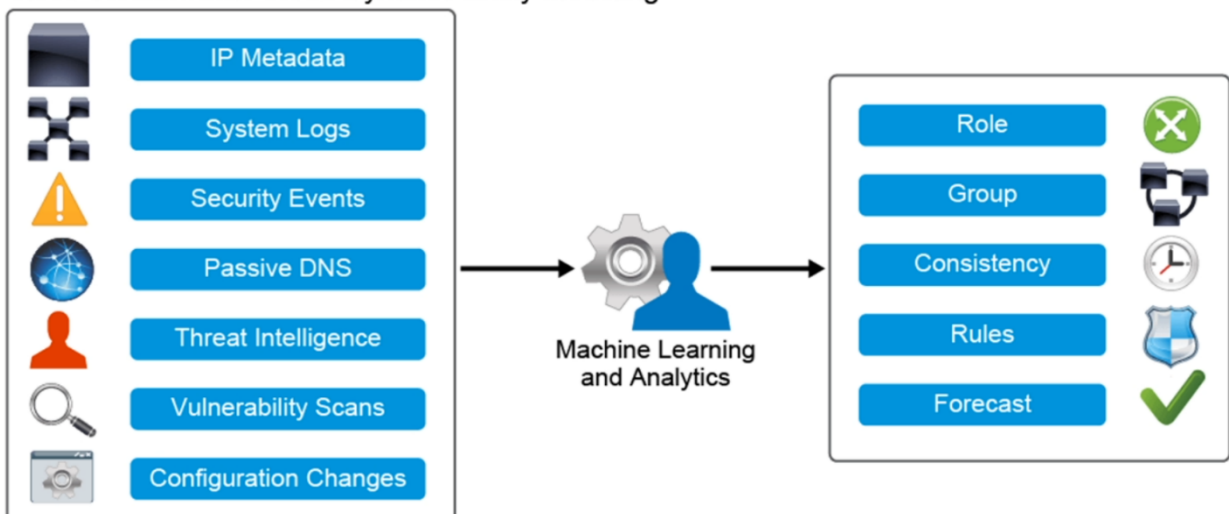

Secure Cloud Analytics (formerly Stealthwatch Cloud) is a SaaS-based, efficient way to gain visibility and threat detection. Secure Cloud Analytics offers easy-to-deploy passive network security monitoring. Identify indicators of compromise in real time. Automate threat detection and alerting. Reduce security incident response times. Use it in your public cloud, private network, or both.

Cisco Secure Network Analytics (Stealthwatch) provides enterprise-wide visibility, from the private network to the public cloud to detect and respond to threats in real-time.

Cisco Stealthwatch Cloud Dynamic Entity Modeling

Cisco Stealthwatch:

Lancope was founded back in 2000 and is a leading provider of network visibility and security intelligence to protect enterprises against today's top threats. The StealthWatch System uses NetFlow and other types of network telemetry to detect a wide range of attacks from a variety of threats including DDoS, zero-day malware and insider threats. Cisco acquired Lancope several years ago and further developed their Stealthwatch solution. This solution allows network administrators and cybersecurity professionals to analyze network telemetry in a timely manner to defend against advanced cyber threats such as Network reconnaissance, Malware and Data Exfiltration.

Cisco Stealthwatch aggregates and normalizes considerable amounts of NetFlow data to apply security analytics to detect malicious and suspicious activity. It provides context-aware security for real-time threat detection and forensic response. StealthWatch as a tool that bridges the gap between existing security controls that are out there and provides complete visibility into what's happening in your network. The minimum requirements for the StealthWatch System are a StealthWatch Management Console (SMC) and at least one FlowCollector. The SMC allows administrators to view, understand and act on network and security data through a single interface. The FlowCollector collects and analyzes data from existing network infrastructure to provide the complete picture of everything happening in the environment.

Stealthwatch Cloud:

Stealthwatch Cloud is a Software as a Service (SaaS) cloud solution. There is no need to maintain hardware or apply patches, and new features are added automatically on a monthly basis. Ultimately, this approach massively reduces the time spent implementing and managing the solution. You can use Stealthwatch Cloud to monitor many different public cloud environments, such as Amazon's AWS, Google Cloud Platform, and Microsoft Azure. All of these cloud providers support implementation of NetFlow. In Amazon AWS, the equivalent of NetFlow is called VPC Flow Logs. Google Cloud Platform also supports VPC Flow Logs. In Microsoft's Azure, traffic flows are collected in Network Security Group (NSG) flow logs. Cisco Stealthwatch Cloud was created to help secure public cloud workloads while remaining easy to use and efficient. It is a cloud-native method to detect early-stage indicators of compromise and gain visibility in your public cloud.
