

Pre-Filtering:

- In Cisco Firepower FTD the Pre-Filtering is the optional first step of access control (ACP).
- In Cisco FTD a pre-filter policy contains rules that match simple values, like IP's and ports.
- In Cisco Firepower FTD, there is no deep packet inspection in a pre-filter access policy.
- One of reasons to use this is to quickly allow or deny traffic, without deeper inspection.
- It blocks traffic without wasting more resources and without wasting additional resources.
- Traffic can also be put on Fast-Path, which allows traffic while bypassing deeper inspection.
- For example, you may want to allow ICMP traffic for troubleshooting without going to ACP.
- You could add this to the pre-filter policy with an action of fast-path, saving the resources.
- If the pre-filter access policy rules do not match, then the Access Control Policy takes over.
- Prefilter is a normal Access Control List style rule, that used to block or Fastpath traffic.
- Prefilter, traffic can also be passed to the Access Control Policy (ACP) for deep inspection.
- The Prefilter Policy is L2-4 Access Lists and can be compared to the Access Lists in ASA.
- We are able to create two sets of rules in Prefilter Policy, Prefilter Rules and Tunnels Rules.
- The Prefilter Rule is used for the L2-L4 rules - Zones, Networks, VLAN Tags and Ports etc.
- Tunnel Rule is used to bypass encapsulated traffic based on IP Headers (GRE, IP-in-IP etc).
- It provides Early Access Control (EAC) which allows flow to bypass completely Snort engine.

Action	Description
Analyze	Sends traffic for further inspection, pass traffic to ACP for deep analysis
Block	Blocks the traffic without further inspection.
Fastpath	Allows the connection without further inspection, traffic bypasses ACP.

Pre-Filter policies are in **Policies -> Access Control -> Prefilter**.

Add Prefilter Rule

ⓘ Prefilter rules perform early handling of traffic based on simple network characteristics. Fastpathed traffic bypasses access control and QoS.
